# 1 Probability Review

This section is meant to quick review and introduce the equations that will be used throughout this course. It is not meant to be comprehensive and/or in-depth. For more information about the topic of probability and statistics, refer to the Math 374 - Probability and Statistics document.

## 1.1 Axioms of Probability

**Defn 1** (Sample Space). The *sample space* is the set of all possible outcomes in a random experiment. It is denoted with the capital Greek omega.

$$\Omega \tag{1.1}$$

**Defn 2** (Event). An *event* is a subset of the Sample Space that we are interested in. These are generally denoted with capital letters.

$$A \subseteq \Omega \tag{1.2}$$

**Defn 3** (Mutually Exclusive). Any two Events are *mutually exclusive* if the equation below holds.

$$P(A \cup B) = P(A) + P(B) \tag{1.3}$$

Laws that follow from the above definitions (Definitions 1 to 3).

1. The conjugate of the Event occurring, i.e. the Event **not** occurring is:

$$P(\bar{A}) = 1 - P(A) \tag{1.4}$$

2. The probability of the union of 2 Events is:

$$P(A \cap B) = P(A) + P(B) - P(A \cup B) \tag{1.5}$$

- If  $A$  and  $B$  are Mutually Exclusive, then  $P(A \cup B) = 0$ .

## 1.2 Conditional Probability

**Defn 4** (Conditional Probability). *Conditional probability* is the probability of an Event occurring when it is known that another Event occurred.

$$P(A|B) = \frac{P(A \cap B)}{P(B)} \tag{1.6}$$

**Defn 5** (Independent). Events are *independent* if the probability of the events' intersection is the same as their probabilities multiplied together.

$$P(A \cap B) = P(A)P(B) \tag{1.7}$$

*Remark 5.1* (Conditional Probability and Independent Events). If  $A$  and  $B$  are Events and are Independent, then

$$\begin{aligned} P(A|B) &= P(A) \\ P(B|A) &= P(B) \end{aligned} \tag{1.8}$$

## 1.3 Random Variables

**Defn 6** (Random Variable). A *random variable* is a mapping from an Event's outcome to a real number.

There are 2 types of random variables, based on what the mapping ends up with:

1. Discrete Random Variables are mapped to integers,  $\mathbb{Z}$ .
2. Continuous Random Variables are mapped to the real numbers,  $\mathbb{R}$ .

### 1.3.1 Discrete Random Variables

**Defn 7** (Discrete Random Variable). A *Discrete Random Variable* is one whose values are mapped from an Event's outcome to the integer numbers ( $\mathbb{Z}$ ). These Random Variables are drawn from outcomes that are finite (sides on a die) or countably infinite.

The probability of a single value of the discrete random variable is denoted differently here than in the course material. The subscript refers to which discrete random variable we are working with (in this case  $X$ ) and the variable in parentheses is the value we are calculating for (in this case  $x \in X$ ).

$$p_X(x) \tag{1.9}$$

The sum of all probabilities for values that the discrete random variable can take **must** sum to 1.

$$\sum_{x \in X} p_X(x) = 1 \tag{1.10}$$

The mean or expected value of a discrete random variables is shown below:

$$\begin{aligned} \mu &= \sum_{x \in X} x p_X(x) \\ \mathbb{E}[x] &= \sum_{x \in X} x p_X(x) \end{aligned} \tag{1.11}$$

The variance of a discrete random variable is how “off” a value from the random variable is from the mean/expected value.

$$\begin{aligned} \sigma^2 &= \sum_{x \in X} (x - \mu)^2 p_X(x) \\ \text{VAR}[x] &= \sum_{x \in X} (x - \mathbb{E}[x])^2 p_X(x) \end{aligned} \tag{1.12}$$

The standard deviation is the square root of the variance.

$$\begin{aligned} \sigma &= \sqrt{\sigma^2} = \sqrt{\sum_{x \in X} (x - \mu)^2 p_X(x)} \\ \text{STD}[x] &= \sqrt{\text{VAR}[x]} = \sqrt{\sum_{x \in X} (x - \mathbb{E}[x])^2 p_X(x)} \end{aligned} \tag{1.13}$$

There are 5 different Discrete Random Variable distributions that we will be heavily utilizing in this course.

#### 1.3.1.1 Uniform Random Variable

**Defn 8** (Uniform Random Variable). The *uniform random variable* is a Discrete Random Variable whose probabilities for each outcome is equal.

For a Discrete Random Variable  $X$ , which has  $|X|$  possible values,

$$p_X(x) = \frac{1}{|X|} \tag{1.14}$$

#### Example 1.1: Uniform Random Variable. Lecture 1

For example, the roll of a die is typically modelled as a uniform random variable. Find the probability distribution function, the expected value, and the variance.

Let's assume this is a 6-sided die. And let's map each side's number to a value in the range of  $X \in [1, 6]$ .

Using Equation (1.14), we can find the probability distribution easily.

$$p_X(x) = \begin{cases} \frac{1}{6} & x = 1 \\ \frac{1}{6} & x = 2 \\ \frac{1}{6} & x = 3 \\ \frac{1}{6} & x = 4 \\ \frac{1}{6} & x = 5 \\ \frac{1}{6} & x = 6 \end{cases}$$

Using Equation (1.11), we can find the the expected value/mean.

$$\begin{aligned} \mu = \mathbb{E}[x] &= \sum_{x=1}^6 x p_X(x) \\ &= \frac{1}{6} + \frac{2}{6} + \frac{3}{6} + \frac{4}{6} + \frac{5}{6} + \frac{6}{6} \\ &= \frac{1 + 2 + 3 + 4 + 5 + 6}{6} \\ &= \frac{21}{6} = 3.5 \end{aligned}$$

Using Equation (1.12), we can find the variance.

$$\begin{aligned} \sigma^2 = \text{VAR}[x] &= \sum_{x=1}^6 (x - \mathbb{E}[x])^2 p_X(x) \\ &= \sum_{x=1}^6 (x - 3.5)^2 \left(\frac{1}{6}\right) \\ &= 2.91667 \end{aligned}$$

Using Equation (1.13), we can find the standard deviation.

$$\begin{aligned} \sigma = \text{STD}[x] &= \sqrt{\sum_{x=1}^6 (x - \mathbb{E}[x])^2 p_X(x)} \\ &= \sqrt{\sum_{x=1}^6 (x - 3.5)^2 \left(\frac{1}{6}\right)} \\ &= \sqrt{2.91667} \\ &= 1.70783 \end{aligned}$$

### 1.3.1.2 Bernoulli Random Variable

**Defn 9** (Bernoulli Random Variable). The *Bernoulli random variable* is one where **only one** test occurs, and there are only 2 outcomes.

The probability of success is denoted

$$p_X(\text{success}) = p \tag{1.15}$$

The probability of failure is denoted

$$p_X(\text{failure}) = 1 - p \tag{1.16}$$

The mean/expected value is:

$$\mu = \mathbb{E}[x] = p \tag{1.17}$$

The variance is:

$$\sigma^2 = \text{VAR}[x] = (1 - p)p \tag{1.18}$$

### 1.3.1.3 Binomial Random Variable

**Defn 10** (Binomial Random Variable). The *binomial random variable* is one where  $n$  trials are run with no stops for a success, where the Random Variable in each run is a Bernoulli Random Variable.

The probability of  $k$  successes with  $n$  trials is

$$\binom{n}{k} p^k (1-p)^{n-k} = \frac{n!}{k!(n-k)!} (1-p)^{n-k} \quad (1.19)$$

The mean/expected value after  $n$  trials is

$$\mu = \mathbb{E}[x] = np \quad (1.20)$$

The variance after  $n$  trials is

$$\sigma^2 = \text{VAR}[x] = np(1-p) \quad (1.21)$$

### 1.3.1.4 Geometric Random Variable

**Defn 11** (Geometric Random Variable). The *geometric random variable* is one where  $n$  trials are run, where the  $n$ th trial is a success, meaning there are  $n-1$  previous failures. The Random Variable in each run is a Bernoulli Random Variable.

This means **each trial** has a probability of success of

$$p_X(\text{success}) = p \quad (1.22)$$

And **each trial** has a probability of failure of

$$p_X(\text{failure}) = 1-p \quad (1.23)$$

The mean/expected value is

$$\mu = \mathbb{E}[x] = \frac{1}{p} \quad (1.24)$$

The variance is

$$\sigma^2 = \text{VAR}[x] = \frac{1-p}{p^2} \quad (1.25)$$

### 1.3.1.5 Poisson Random Variable

**Defn 12** (Poisson Random Variable). The *Poisson random variable* is used to model the number of independent events that occur over a given period of time.

The Poisson random variable has one parameter,

$$\lambda \quad (1.26)$$

$\lambda$  is the average number of events per unit of time.

The probability function for the value of  $x \in X$  of this random variable is

$$p_X(x) = e^{-\lambda} \left( \frac{\lambda^x}{x!} \right) \quad (1.27)$$

The mean/expected value is

$$\mu = \mathbb{E}[x] = \lambda \quad (1.28)$$

The variance is

$$\sigma^2 = \text{VAR}[x] = \lambda \quad (1.29)$$

## 1.3.2 Continuous Random Variables

**Defn 13** (Continuous Random Variable). A *Continuous Random Variable* is one whose values are mapped from an Event's outcome to the real numbers ( $\mathbb{R}$ ).

# A Complex Numbers

Complex numbers are numbers that have both a real part and an imaginary part.

$$z = a \pm bi \quad (\text{A.1})$$

where

$$i = \sqrt{-1} \quad (\text{A.2})$$

*Remark* ( $i$  vs.  $j$  for Imaginary Numbers). Complex numbers are generally denoted with either  $i$  or  $j$ . Since this is an appendix section, I will denote complex numbers with  $i$ , to make it more general. However, electrical engineering regularly makes use of  $j$  as the imaginary value. This is because alternating current  $i$  is already taken, so  $j$  is used as the imaginary value instead.

$$Ae^{-ix} = A [\cos(x) + i \sin(x)] \quad (\text{A.3})$$

## A.1 Complex Conjugates

If we have a complex number as shown below,

$$z = a \pm bi$$

then, the conjugate is denoted and calculated as shown below.

$$\bar{z} = a \mp bi \quad (\text{A.4})$$

**Defn A.1.1** (Complex Conjugate). The conjugate of a complex number is called its *complex conjugate*. The complex conjugate of a complex number is the number with an equal real part and an imaginary part equal in magnitude but opposite in sign.

The complex conjugate can also be denoted with an asterisk (\*). This is generally done for complex functions, rather than single variables.

$$z^* = \bar{z} \quad (\text{A.5})$$

### A.1.1 Complex Conjugates of Exponentials

$$\overline{e^z} = e^{\bar{z}} \quad (\text{A.6})$$

$$\overline{\log(z)} = \log(\bar{z}) \quad (\text{A.7})$$

### A.1.2 Complex Conjugates of Sinusoids

Since sinusoids can be represented by complex exponentials, as shown in Appendix B.2, we could calculate their complex conjugate.

$$\begin{aligned} \overline{\cos(x)} &= \cos(x) \\ &= \frac{1}{2} (e^{ix} + e^{-ix}) \end{aligned} \quad (\text{A.8})$$

$$\begin{aligned} \overline{\sin(x)} &= \sin(x) \\ &= \frac{1}{2i} (e^{ix} - e^{-ix}) \end{aligned} \quad (\text{A.9})$$

## B Trigonometry

### B.1 Trigonometric Formulas

$$\sin(\alpha) + \sin(\beta) = 2 \sin\left(\frac{\alpha + \beta}{2}\right) \cos\left(\frac{\alpha - \beta}{2}\right) \quad (\text{B.1})$$

$$\cos(\theta) \sin(\theta) = \frac{1}{2} \sin(2\theta) \quad (\text{B.2})$$

### B.2 Euler Equivalents of Trigonometric Functions

$$e^{\pm j\alpha} = \cos(\alpha) \pm j \sin(\alpha) \quad (\text{B.3})$$

$$\cos(x) = \frac{e^{jx} + e^{-jx}}{2} \quad (\text{B.4})$$

$$\sin(x) = \frac{e^{jx} - e^{-jx}}{2j} \quad (\text{B.5})$$

$$\sinh(x) = \frac{e^x - e^{-x}}{2} \quad (\text{B.6})$$

$$\cosh(x) = \frac{e^x + e^{-x}}{2} \quad (\text{B.7})$$

### B.3 Angle Sum and Difference Identities

$$\sin(\alpha \pm \beta) = \sin(\alpha) \cos(\beta) \pm \cos(\alpha) \sin(\beta) \quad (\text{B.8})$$

$$\cos(\alpha \pm \beta) = \cos(\alpha) \cos(\beta) \mp \sin(\alpha) \sin(\beta) \quad (\text{B.9})$$

### B.4 Double-Angle Formulae

$$\sin(2\alpha) = 2 \sin(\alpha) \cos(\alpha) \quad (\text{B.10})$$

$$\cos(2\alpha) = \cos^2(\alpha) - \sin^2(\alpha) \quad (\text{B.11})$$

### B.5 Half-Angle Formulae

$$\sin\left(\frac{\alpha}{2}\right) = \sqrt{\frac{1 - \cos(\alpha)}{2}} \quad (\text{B.12})$$

$$\cos\left(\frac{\alpha}{2}\right) = \sqrt{\frac{1 + \cos(\alpha)}{2}} \quad (\text{B.13})$$

### B.6 Exponent Reduction Formulae

$$\sin^2(\alpha) = \frac{1 - \cos(2\alpha)}{2} \quad (\text{B.14})$$

$$\cos^2(\alpha) = \frac{1 + \cos(2\alpha)}{2} \quad (\text{B.15})$$

### B.7 Product-to-Sum Identities

$$2 \cos(\alpha) \cos(\beta) = \cos(\alpha - \beta) + \cos(\alpha + \beta) \quad (\text{B.16})$$

$$2 \sin(\alpha) \sin(\beta) = \cos(\alpha - \beta) - \cos(\alpha + \beta) \quad (\text{B.17})$$

$$2 \sin(\alpha) \cos(\beta) = \sin(\alpha + \beta) + \sin(\alpha - \beta) \quad (\text{B.18})$$

$$2 \cos(\alpha) \sin(\beta) = \sin(\alpha + \beta) - \sin(\alpha - \beta) \quad (\text{B.19})$$

## B.8 Sum-to-Product Identities

$$\sin(\alpha) \pm \sin(\beta) = 2 \sin\left(\frac{\alpha \pm \beta}{2}\right) \cos\left(\frac{\alpha \mp \beta}{2}\right) \quad (\text{B.20})$$

$$\cos(\alpha) + \cos(\beta) = 2 \cos\left(\frac{\alpha + \beta}{2}\right) \cos\left(\frac{\alpha - \beta}{2}\right) \quad (\text{B.21})$$

$$\cos(\alpha) - \cos(\beta) = -2 \sin\left(\frac{\alpha + \beta}{2}\right) \sin\left(\frac{\alpha - \beta}{2}\right) \quad (\text{B.22})$$

## B.9 Pythagorean Theorem for Trig

$$\cos^2(\alpha) + \sin^2(\alpha) = 1^2 \quad (\text{B.23})$$

## B.10 Rectangular to Polar

$$a + jb = \sqrt{a^2 + b^2} e^{j\theta} = r e^{j\theta} \quad (\text{B.24})$$

$$\theta = \begin{cases} \arctan\left(\frac{b}{a}\right) & a > 0 \\ \pi - \arctan\left(\frac{b}{a}\right) & a < 0 \end{cases} \quad (\text{B.25})$$

## B.11 Polar to Rectangular

$$r e^{j\theta} = r \cos(\theta) + j r \sin(\theta) \quad (\text{B.26})$$

## C Calculus

### C.1 Fundamental Theorems of Calculus

**Defn C.1.1** (First Fundamental Theorem of Calculus). The *first fundamental theorem of calculus* states that, if  $f$  is continuous on the closed interval  $[a, b]$  and  $F$  is the indefinite integral of  $f$  on  $[a, b]$ , then

$$\int_a^b f(x) dx = F(b) - F(a) \quad (\text{C.1})$$

**Defn C.1.2** (Second Fundamental Theorem of Calculus). The *second fundamental theorem of calculus* holds for  $f$  a continuous function on an open interval  $I$  and  $a$  any point in  $I$ , and states that if  $F$  is defined by

$$F(x) = \int_a^x f(t) dt,$$

then

$$\begin{aligned} \frac{d}{dx} \int_a^x f(t) dt &= f(x) \\ F'(x) &= f(x) \end{aligned} \quad (\text{C.2})$$

**Defn C.1.3** (argmax). The arguments to the *argmax* function are to be maximized by using their derivatives. You must take the derivative of the function, find critical points, then determine if that critical point is a global maxima. This is denoted as

$$\operatorname{argmax}_x$$

### C.2 Rules of Calculus

#### C.2.1 Chain Rule

**Defn C.2.1** (Chain Rule). The *chain rule* is a way to differentiate a function that has 2 functions multiplied together.

If

$$f(x) = g(x) \cdot h(x)$$

then,

$$\begin{aligned} f'(x) &= g'(x) \cdot h(x) + g(x) \cdot h'(x) \\ \frac{df(x)}{dx} &= \frac{dg(x)}{dx} \cdot h(x) + g(x) \cdot \frac{dh(x)}{dx} \end{aligned} \quad (\text{C.3})$$

## D Laplace Transform

**Defn D.0.1** (Laplace Transform). The *Laplace transformation* operation is denoted as  $\mathcal{L}\{x(t)\}$  and is defined as

$$X(s) = \int_{-\infty}^{\infty} x(t)e^{-st}dt \tag{D.1}$$
